

Tool: Reversibility Matrix & Decision Thresholds

Apa: alat klasifikasi keputusan teknis + threshold kapan abstract / lock / build-vs-buy. **Kapan dipake:** sebelum ambil keputusan teknis non-trivial — nentuin perlu ADR + escalate Tata atau enggak. **Framework:** Bezos one-way/two-way door, COBIT APO12 (Risk).

1. Reversibility (Bezos door)

	Type 1 — IRREVERSIBLE (one-way)	Type 2 — REVERSIBLE (two-way)
Contoh	Schema/data model, public API contract, security tradeoff, vendor lock, ganti stack	Internal refactor, UI tweak, feature flag, naming
Proses	bruce + archival, lengthy review, ADR wajib	Fast decision, no archival
Wewenang	🔴 Escalate Tata	🟢 Bebas (Kakashi)

Default kalau ragu: treat as Type 1 (lebih aman).

2. Abstraction timing — Rule of 3

Usage	Action
1	Inline (jangan abstract — premature)
2	Duplicate OK
3	Abstract sekarang
5+	Udah telat, refactor utang

3. Lock pattern threshold

3 area → lock di style guide. > 5 area → enforce lint/CI. 1-2 area → inline.

4. Build vs Buy

Verdict	Syarat
Build	Core competency + no good vendor + < 1 dev-month
Buy	Commodity + vendor mature + > 3 dev-month
Wait	Kebutuhan unclear / hype-driven

5. Refactor scope

< 50 lines → inline (this PR) · > 50 → follow-up PR · > 200 / cross-team → tech debt log.

CONTOH TERISI

Keputusan: "Aplikasi web — payment digital, integrasi payment gateway sekarang atau nanti?"

Reversibility: Type 1 (vendor lock + security + data finansial) →  ESCALATE TATA
Build vs Buy: BUY (payment = commodity, vendor mature, building PCI-compliant > 3 dev-month)
Action: bikin ADR, escalate ke Tata buat pilih provider + timing.
Sementara: abstract di balik interface PaymentProvider (Rule of 3 belum kena, tapi Type-1 → desain boundary dulu biar swap provider gampang).

Hasil: keputusan gak diambil diam-diam — naik ke Tata dengan tradeoff jelas. Itu Accountability (TARIF).
