

Tool: ADR Strategis (Architecture Decision Record)

Apa: catatan 1-halaman keputusan arsitektur **level-strategis** (lintas-fitur/app) — apa yang dipilih, kenapa, alternatif apa yang dibuang. **Kapan dipakai:** SOP-SG-04. Keputusan arsitektur **Type-1 (irreversible)** — vendor/stack lock, data residency, security tradeoff, pola integrasi yang ngiket lintas app. Type-2 reversible gak wajib ADR. **Framework:** TOGAF ADM fase G/H (Governance), COBIT APO03, GCG/TARIF (transparency + audit trail). **Beda dari ADR @kakashi:** Sogeking = **arah solusi strategis**, @kakashi = **pola code-level**. ADR Type-1 **co-owned** — **co-arsip di** `team/kakashi/adr/NNN-*.md` biar satu sumber kebenaran. Sogeking pegang arah, @kakashi pegang feasibility eksekusi.

TEMPLATE (copy mulai sini)

```
# ADR-NNN: <judul keputusan>

**Pengambil keputusan:** Sogeking (arah) · **co-own:** @kakashi (feasibility/code-level)
**Status:** Proposed → Accepted / Superseded / Deprecated
**Tanggal:** YYYY-MM-DD · **Consulted:** @personal, @persona2 · **Reversibility:** Type-1 / Type-2

## Konteks
<situasi yang trigger keputusan – driver bisnis/teknis, constraint, 1 paragraf>

## Reversibility

- Type-1 (one-way 🛑) / Type-2 (two-way 🔄) · alasan klasifikasi: ...

## Opsi dipertimbangkan (≥2)
| Opsi | Pro | Con / trade-off | Verdict |
|---|---|---|---|
| A | ... | ... | ditolak: ... |
| B (dipilih) | ... | ... | ✅ dipilih |
| C | ... | ... | ditolak: ... |

## Keputusan + rationale
<apa yang dipilih + kenapa menang vs alternatif – 1 paragraf, eksplisit trade-off>

## Konsekuensi

- Positif: ...
- Trade-off/negatif: ...
- Guardrail yang lahir: ...

## Escalation / sign-off Tata (wajib jika Type-1)

- [ ] Type-1 → di-escalate & di-sign-off Tata (tanggal: ..., konteks: visible/biaya/lock)
- [ ] Reality-checked feasibility ke @kakashi
```

Follow-up

- ...

CONTOH TERISI

ADR-001: Pola notifikasi gift wishlist – polling client-side, bukan push service eksternal

Pengambil keputusan: Sogeking (arah) · **co-own:** @kakashi (feasibility/code-level)

Status: Accepted

Tanggal: 2026-05-29 · **Consulted:** @shikamaru, @senku, @kakashi · **Reversibility:** Type-1

Konteks

Fitur USP wedding app: tamu klaim kado di wishlist → tuan rumah dapet notif. Muncul pilihan: pakai push service eksternal (vendor realtime) atau polling sederhana di client. Prototype jalan di Fauxbase driver local (memory), belum ada backend persistent. Vendor realtime = **lock-in

Reversibility

- Type-1 (one-way 🚫) – masuk vendor realtime = lock-in kontrak + data pribadi tamu keluar (UU PDP)

Opsi dipertimbangkan

Opsi	Pro	Con / trade-off	Verdict
------	-----	-----------------	---------

---	---	---	---
-----	-----	-----	-----

Push service eksternal	realtime instan, scalable	vendor lock-in, data tamu nyebrang (UU PDP)	
------------------------	---------------------------	---	--

Polling client-side via Service method (dipilih)	0 vendor, data tetap di Fauxbase, cukup buat		
--	--	--	--

WebSocket self-host	realtime, no vendor	infra berat, YAGNI buat prototype	ditolak: over-engineering
---------------------	---------------------	-----------------------------------	---------------------------

Keputusan + rationale

Pakai **polling client-side** lewat method `GiftService.pollClaims()` (interval wajar). Notif delay

Konsekuensi

- Positif: 0 biaya vendor, data privacy aman, prototype jalan tanpa backend.
- Trade-off: notif gak instan; kalau user ribuan, polling boros – re-evaluate via ADR baru.
- Guardrail: semua notif lewat `NotifChannel` interface; jangan panggil vendor langsung dari kompo

Escalation / sign-off Tata

- [x] Type-1 → di-sign-off Tata 2026-05-29 (konteks: privacy data tamu + no vendor lock)
- [x] Reality-checked feasibility ke @kakashi (Service method polling = feasible di Fauxbase)

Follow-up

- Re-evaluate kalau skala > ratusan concurrent → ADR baru bisa supersede ini.

ADR ini naikin keputusan ke Tata dengan trade-off jelas (privacy vs realtime) — bukan diam-diam masuk vendor. Itu Accountability (TARIF) + kontrol SG-C1/SG-C6.
