

Tool: Build vs Buy vs Partner — Decision Aid

Apa: alat bantu keputusan bikin-sendiri / beli-vendor / kerja-sama, plus decision tree. **Kapan dipake:** ada kebutuhan kapabilitas yang bisa dibeli/diintegrasikan (SOP-SG-03, TOGAF ADM fase E — Opportunities & Solutions). **Framework:** reversibility matrix (lock-in vendor = otomatis **Type-1**) · Well-Architected (cost/ops) · filter @senku · escalate @tata kalau Type-1.

Kriteria penentu

Pertanyaan	Condong ke
Ini core differentiator kita (alasan user pilih app kita)?	Ya → Build
Vendor mature & terpercaya ada?	Ya → Buy/Partner
ROI: building > 3 dev-month tapi commodity?	Ya → Buy
Reversible? Bisa keluar tanpa rombak?	Type-2 → aman beli · Type-1 → escalate Tata
Lock-in tinggi (data/format/API terkunci vendor)?	Type-1 → wajib exit plan + ADR
Kebutuhan masih unclear / hype-driven ?	→ Wait (YAGNI)

Decision tree

```
Apakah ini CORE DIFFERENTIATOR?
├─ YA → kebutuhan jelas?
│   ├── YA → BUILD (di balik interface, build-for-change)
│   └── TIDAK → WAIT (YAGNI, jangan bangun yang belum perlu)
└─ TIDAK (commodity) → vendor mature ada?
    ├── YA → lock-in / data sensitif?
    │   ├── tinggi → Type-1: BUY/PARTNER + exit plan + ADR + escalate @tata
    │   └── rendah → Type-2: BUY (gas, abstract di balik interface)
    └── TIDAK → komplementer & dua-duanya untung?
        ├── YA → PARTNER
        └── TIDAK → BUILD minimal / WAIT
```

CONTOH TERISI

Kasus 1 — Payment gateway (Wedding App go-live)

- Core differentiator? **Tidak** (commodity). Vendor mature? **Ya** (Midtrans/Xendit).

- Building PCI-compliant > 3 dev-month + data finansial sensitif + lock-in API.
- **Verdict: BUY**, tapi **Type-1** (vendor lock + security + data finansial) → **ADR + escalate @tata** pilih provider & timing. Abstract di balik interface `PaymentProvider` biar swap mungkin (build-for-change).
- Filter @senku untuk shortlist provider. **Bukan diambil diam-diam** (Accountability).

Kasus 2 — Image hosting (foto gallery undangan)

- Core differentiator? **Tidak**. Vendor mature? **Ya** (Cloudinary/S3). Lock-in? **Rendah** (file = standar).
- **Verdict: BUY** (Type-2) → gak perlu escalate, abstract di balik `ImageStore`. Prototype: pakai Fauxbase/asset lokal dulu (cost \$0), swap ke hosting saat go-live. **WAIT** untuk infra real sampai ada user nyata (YAGNI).

Keputusan + verdict diarsip di log; kasus Type-1 nyambung ke adr-template + reversibility-matrix.
